New Products

We're happy to announce an extension of our IP-based **DS-6** intercom, public address and alarm system. In future, you will be able to connect the DS-6 to weather-proof, digital call stations (WFD). For this purpose, we're developing an interface adapter that enables you to link a maximum of eight Uk0 call stations.

Just like the other active DS-6 call stations and call station modules, this adapter will allow for network redundancy.

The advantage is that distances of up to six kilometres can be covered even in the case of low cable quality to the call stations.

Completion: end of April 2008

Information about our new products

We conduct free information sessions at regular intervals.

Our next information session is scheduled for April 1, 2008.

We would be happy to welcome you in our company for this event.

A special invitation will be sent to you within the next few days.

Network of IP-based emergency call stations to be installed in tunnels of Berlin federal motorways

The first complete emergency call system network will be put into operation within the next few days under the supervision of the Berlin tunnel control center.

At first, the tunnels “Flughafen Tegel (A111)”, “Rudower Höhe” as well as “Altglienicke” (the latter two lying within the A113) will be equipped with a total of 65 state-of-the-art IP-based emergency call stations manufactured by **ms Neumann Elektronik Ltd.**

Two LWL rings for each tunnel, alternately linked to the emergency call stations, will ensure a high degree of reliability and system stability.

Two redundant and independent servers will not only monitor all end devices but also relay operating conditions and calls to the higher-level control center. Emergency calls will be received by the IP-based control center switchboard.

Future stages of expansion include extending the system to other tunnels within the network.

As a result, proprietary cable paths are no longer required. The emergency call system is integrated in the same network as the other electronic systems for video, fire alarm, traffic control, emission measurement, etc.
